**Three Way
Transfer Valve**

Three Way Transfer Valve

The Model 77-8 three way transfer valve is used alone or with differential gap controllers, lockup valves and other equipment in pneumatic control circuits to add flexibility to devices such as valves, load applicators and instruments.

A pneumatic signal or air supply is piped to a spring opposed diaphragm which actuates a double faced soft seat plug. As long as a pressure exists at one of the signal ports (S) in

excess of the set pressure of the unit, the normally open port (NO) is closed and flow through the valve is from the common port (C) to the normally closed port (NC) or from NC to C. When the signal pressure falls below the set valve, the spring closes port NC and opens NO to allow flow from port C to port NO, or from port NO to port C. Signal pressure is sealed off from the valve body by an O-Ring.

**For use with air operated valves,
load applicators and instruments**
